SUCCESSFUL SUBMISSIONS

Kattapa, as you all know was one of the greatest warriors of his time. The kingdom of Maahishmati had never lost a battle under him (as army-chief), and the reason for that was their really powerful army, also called as **Mahasena**.

Kattapa was known to be a very superstitious person. He believed that a soldier is "lucky" if the soldier is holding an **even number** of weapons, and "unlucky" otherwise. He considered the army as "READY FOR BATTLE" if the count of "lucky" soldiers is strictly greater than the count of "unlucky" soldiers, and "NOT READY" otherwise.

Given the number of weapons each soldier is holding, your task is to determine whether the army formed by all these soldiers is "READY FOR BATTLE" or "NOT READY".

Note: You can find the definition of an even number [here](#).

Input

The first line of input consists of a single integer N denoting the number of soldiers. The second line of input consists of N space separated integers A_1, A_2, \dots, A_N , where A_i denotes the number of weapons that the i^{th} soldier is holding.

Output

Generate one line output saying "READY FOR BATTLE", if the army satisfies the conditions that Kattapa requires or "NOT READY" otherwise (quotes for clarity).

Constraints

- $1 \leq N \leq 100$
- $1 \leq A_i \leq 100$

Example 1

Input:

1
1

Output:

NOT READY

Example 2

Input:

1
2

Output:

READY FOR BATTLE

Example 3

Input:

4
11 12 13 14

Output:

NOT READY

Example 4

Input:

3
2 3 4

Output:

READY FOR BATTLE

Example 5

Input:

5
1 2 3 4 5

Output:

NOT READY

Explanation

- Example 1:** For the first example, $N = 1$ and the array $A = [1]$. There is only 1 soldier and he is holding 1 weapon, which is odd. The number of soldiers holding an even number of weapons = 0, and number of soldiers holding an odd number of weapons = 1. Hence, the answer is "NOT READY" since the number of soldiers holding an even number of weapons is not greater than the number of soldiers holding an odd number of weapons.
- Example 2:** For the second example, $N = 1$ and the array $A = [2]$. There is only 1 soldier and he is holding 2 weapons, which is even. The number of soldiers holding an even number of weapons = 1, and number of soldiers holding an odd number of weapons = 0. Hence, the answer is "READY FOR BATTLE"

- since the number of soldiers holding an even number of weapons is greater than the number of soldiers holding an odd number of weapons.
- **Example 3:** For the third example, $N = 4$ and the array $A = [11, 12, 13, 14]$. The 1st soldier is holding 11 weapons (which is odd), the 2nd soldier is holding 12 weapons (which is even), the 3rd soldier is holding 13 weapons (which is odd), and the 4th soldier is holding 14 weapons (which is even). The number of soldiers holding an even number of weapons = 2, and number of soldiers holding an odd number of weapons = 2. Notice that we have an **equal** number of people holding even number of weapons and odd number of weapons. The answer here is "NOT READY" since the number of soldiers holding an even number of weapons is **not strictly greater than** the number of soldiers holding an odd number of weapons.
 - **Example 4:** For the fourth example, $N = 3$ and the array $A = [2, 3, 4]$. The 1st soldier is holding 2 weapons (which is even), the 2nd soldier is holding 3 weapons (which is odd), and the 3rd soldier is holding 4 weapons (which is even). The number of soldiers holding an even number of weapons = 2, and number of soldiers holding an odd number of weapons = 1. Hence, the answer is "READY FOR BATTLE" since the number of soldiers holding an even number of weapons is greater than the number of soldiers holding an odd number of weapons.
 - **Example 5:** For the fifth example, $N = 5$ and the array $A = [1, 2, 3, 4, 5]$. The 1st soldier is holding 1 weapon (which is odd), the 2nd soldier is holding 2 weapons (which is even), the 3rd soldier is holding 3 weapons (which is odd), the 4th soldier is holding 4 weapons (which is even), and the 5th soldier is holding 5 weapons (which is odd). The number of soldiers holding an even number of weapons = 2, and number of soldiers holding an odd number of weapons = 3. Hence, the answer is "NOT READY" since the number of soldiers holding an even number of weapons is not greater than the number of soldiers holding an odd number of weapons.

CodeChef - A Platform for Aspiring Programmers

CodeChef was created as a platform to help programmers make it big in the world of algorithms, **computer programming** and **programming contests**. At CodeChef we work hard to revive the geek in you by hosting a **programming contest** at the start of the month and another smaller programming challenge in the middle of the month. We also aim to have training sessions and discussions related to **algorithms**, **binary search**, technicalities like **array size** and the likes. Apart from providing a platform for **programming competitions**, CodeChef also has various algorithm tutorials and forum discussions to help those who are new to the world of **computer programming**.

Practice Section - A Place to hone your 'Computer Programming Skills'

Try your hand at one of our many practice problems and submit your solution in a language of your choice. Our **programming contest** judge accepts solutions in over 35+ programming languages. Preparing for coding contests were never this much fun! Receive points, and move up through the CodeChef ranks. Use our practice section to better prepare yourself for the multiple **programming challenges** that take place through-out the month on CodeChef.

Compete - Monthly Programming Contests and Cook-offs

Here is where you can show off your **computer programming** skills. Take part in our 10 day long monthly **coding contest** and the shorter format Cook-off **coding contest**. Put yourself up for recognition and win great prizes. Our **programming contests** have prizes worth up to INR 20,000 (for Indian Community), \$700 (for Global Community) and lots more CodeChef goodies up for grabs.
